Binary Message Protocol

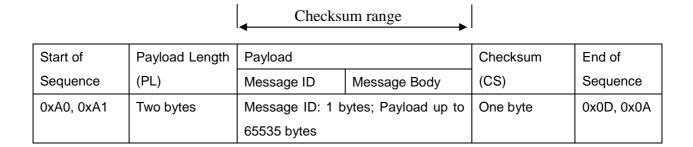

The SkyTraq binary message protocol manual provides the detailed descriptions on the SkyTraq binary protocol serving as a communicating interface between SkyTraq GNSS receivers and an external host such as PC, Notebook and mobile personal device. It is a standard protocol used by all SkyTraq devices and provides users a satisfactory control over the GNSS receivers.

The SkyTraq GNSS receiver outputs standard NMEA messages during normal operation. This NMEA messages may be a scheduled output at a specified rate subject to user's requests. The SkyTraq binary message protocol is designed with cares on reliable transmissions of data, ease & efficiency of implement, and payload independence mechanism which ensure users to retrieve data in a most effective & flexible way. The overall binary protocol messages can be categorized as input and output messages. Input messages provide the functionality to users to control the behavior of the GNSS receiver and to retrieve the detailed information of the GNSS status in real-time. Output messages, on the other hand, are information strings that GNSS receiver responses to requests from hosts and can optionally periodically reports the Position, Velocity and Time (PVT) via NMEA or binary messages.

BINARY MESSAGE STRUCTURE

Message Format

The following picture shows the structure of a binary message.

The syntax of the message is shown below.

<0xA0,0xA1><PL><Message ID><Message Body><CS><0x0D,0x0A>

Start of Sequence

This field contains two bytes of values 0xA0, 0xA1 which indicate start of Messages.

Payload Length

The payload length (PL) field contains 16 bits of value which indicates the length of payload.

Payload

The payload field consists of 2 sub-fields, Message ID and Message Body. Message ID field defines the message ID.

| Sub-Field | Values |
|-----------------|------------|
| Message ID (ID) | 0x01~0xFF |
| Message Body | Data Bytes |

Message Body

The Message Body may further consist of 2 sub-fields, Sub-Message ID (Sub-ID) and Sub-Message Body.

| Sub-Field | Values |
|-----------|--------|
|-----------|--------|

| Sub-Message ID(SID) | 0x01~0xFF |
|---------------------|------------|
| Sub-Message Body | Data Bytes |

Checksum

Checksum (CS) field is transmitted in all messages. The checksum field is the last field in a message before the end of sequence field. The checksum is the 8-bit exclusive OR of only the payload bytes which start from Message ID until the last byte prior to the checksum byte. A reference to the calculation of CS is provided below,

$$CS = 0$$
, $N=PL$;
For $n = 0$ to N
 $CS = CS ^ < Payload Byte # $n > 0$$

End of Sequence

This field contains two bytes of values 0x0D, 0x0A which indicate end of Messages.

Data Byte Ordering

All payloads in binary protocol are transferred in big-endian format. The high order byte is transmitted first followed by the low order byte for data size larger than a byte (e.g. UINT32, DPFP).

Data Type Definition

| UINT8 | 8 bit unsigned integer |
|--------|---|
| UINT16 | 16 bit unsigned integer |
| UINT32 | 32 bit unsigned integer |
| SINT8 | 8 bit signed integer |
| SINT16 | 16 bit signed integer |
| SINT32 | 32 bit signed integer |
| SPFP | 32 bit single precision floating point number |
| DPFP | 64 bit double precision floating point number |

MESSAGE FLOW

Host can perform actions to GNSS receiver by issuing a request or a set message. The message flow between Host and GNSS receiver is designed under the considerations of certain reliable transmission. SkyTraq binary message protocol requires an ACK response from the GNSS receiver upon receiving a successful input message and on the other hand, requires a NACK response from the receiver to a failed input message. Figure 1 shows a message flow that a host requests information from GNSS receiver and the GNSS receiver responses with an ACK and information respectively. Figure 2 shows a message flow with un-successful input message. Therefore, all requests (input messages) will have a corresponding ACK or NACK to be related with. However, output messages will not require the host to confirm by an ACK or NACK back in current design.

MESSAGE LIST

This section provides brief information about available SkyTraq binary input, output and sub-id messages shown in a tabular list. All the messages are listed by Message ID. Full descriptions of input and output messages will be described in later Sections.

QUERY SOFTWARE VERSION – Query revision information of loaded software (0x2)

This is a request message which is issued from the host to GNSS receiver to retrieve loaded software version. The GNSS receiver should respond with an ACK along with information of software version, "SOFTWARE VERSION, ID: 0x80", when succeeded and should respond with an NACK when failed. The payload length is 2 bytes.

SET FACTORY DEFAULTS – Set the system to factory default values (0x4)

This is a request message which is issued from the host to GNSS receiver. It will reset the GNSS receiver's internal parameters to factory default values. The GNSS receiver should respond with an ACK when succeeded and should respond with an NACK when failed. The user data will be erased and filled with factory default values. The payload length is 2 bytes.

CONFIGURE SYSTEM POWER MODE –Set the power mode of GNSS system (0xC)

This is a request message which is issued from the host to GNSS receiver to configure the system power mode. By default power save mode is enabled, to reduce current consumption by the search engine. The GNSS receiver should respond with an ACK when succeeded and should respond with an NACK when failed. The payload length is 3 bytes.

CONFIGURE SYSTEM POSITION RATE – Configure the position update rate of GNSS system (0xE)

This is a request message which is issued from the host to GNSS receiver to configure the system position update rate. Receivers with position rate 4 or higher needs to configure baud rate to 38400 or higher value. The GNSS receiver should respond with an ACK when succeeded and should respond with an NACK when failed. The payload length is 3 bytes.

QUERY POSITION UPDATE RATE – Query the position update rate of GNSS system (0x10)

This is a request message which is issued from the host to GNSS receiver to query position update rate. The GNSS receiver should respond with an ACK along with information of position update rate, "POSITION UPDATE RATE, ID: 0x86", when succeeded and should respond with an NACK when failed. The payload length is 1 byte.

| Payload | d Length : 19 bytes | | | | |

- 1. In order to reduce number of bytes to send in the configure datum command, the Semi-Major Axis is to be deducted by 6,370,000, with the result multiplied by 1,000.
 - Thus if converting 6,378,249.145 the result would be: 6,378,249.145 6,370,000 equals 8,249.145 And converting 8,249.145 x 1000 to hex is 007DDF39.
- 2. Same as for Inversed Flattening which is to be deducted by 293; with the result multiplied by 10,000,000 then converted to hex.
- 3. The exception is: the Inversed Flattening for Ellipsoid index 20 and 23 will lose precision after deducting by 293, multiply by 10,000,000 and convert to hex. Therefore, upon receiving the configure datum command, our firmware will use the internal hardcoded inversed flattening values for of 20 and 23, regardless of what is sent in the set datum command.

CONFIGURE DOP MASK - Configure values of DOP mask (0x2A)

This is a request message which will set the GNSS receiver DOP mode and its corresponding mask. This command is issued from the host to GNSS receiver and GNSS receiver should respond with an ACK or NACK. If either value of PDOP, HDOP or GDOP is not valid, the GNSS receiver will respond with an NACK. The payload length is 9 bytes.

CONFIGURE 1PPS PULSE WIDTH - Configure 1PPS pulse width of GNSS receiver (ID: 0x65, SID: 0x1)

This is a request message which will set the pulse width of 1PPS timing to the GNSS receiver. This command is issued from the host to GNSS receiver and GNSS receiver should respond with an ACK or NACK. If value of pulse width is not valid, the GNSS receiver will respond with an NACK. The payload length is 7 bytes.

GNSS POSITON PINNING STATUS – Position pinning status of the GNSS receiver (0xB4)

This is a response message to "QUERY POSITION PINNING, ID 0x3A" which provides the position pinning status and position pinning parameters of the GNSS receiver. This message is sent from the GNSS receiver to host. The payload length is 12 bytes.

Structure:

<0xA0,0xA1>< PL><B4>< message body><CS><0x0D,0x0A>

Example:

A0 A1 00 0C B4 02 00 02 00 0A 00 08 00 2D 01 F4 67 0D 0A

GNSS POWER MODE STATUS – Power mode status of the GNSS receiver (0xB9)

This is a response message to "QUERY POWER MODE, ID: 0x15" which provides the power mode status of the GNSS receiver. This message is sent from the GNSS receiver to host. The payload length is 2 bytes.

Structure:

<0xA0,0xA1>< PL><B9>< message body><CS><0x0D,0x0A>

Example:

A0 A1 00 02 B9 00 B9 0D 0A

| 2 | Mode | 00 | 00 = Normal (disable power save) 01 = Power Save (enable power save) | UINT8 | | | |
| Payload Length: 2 bytes | | | | | | | |

GNSS 1PPS CABLE DELAY – 1PPS cable delay of the GNSS receiver (0xBB)

This is a response message to "QUERY 1PPS CABLE DELAY, ID: 0x46" which provides the 1PPS cable delay of the GNSS receiver. This message is sent from the GNSS receiver to host. The payload length is 5 bytes.

Structure:

<0xA0,0xA1>< PL><BB>< message body><CS><0x0D,0x0A>

Example:

A0 A1 00 05 BB 00 00 00 00 BB 0D 0A
